

ABSTRACT

A disposable sanitary napkin with a main body and a pair of discrete flaps. Each flap includes an attachment portion secured to the main body. The attachment portion has a first end zone and a second end zone. Each end zone is co-extensive with a portion of a respective transversally extending side of the main body. The flap also includes a projecting portion that extends from the attachment portion. When the sanitary napkin is in use, the projecting portion projects laterally from a longitudinal side of the main body. The projecting portion has at least two layers. The two layers are bonded to one another and form a seal line extending along the periphery of the projecting portion.
